🌐 Hussein Mohamed

Professional Summary

Junior .NET Backend Developer with a Bachelor's degree in Information Technology. Specializes in building scalable, enterprise-level RESTful APIs using .NET 9, Clean Architecture, and the CQRS pattern. Proficient in integrating real-time features, optimizing databases, and deploying applications to the cloud (Microsoft Azure).

Education

Bachelor's degree in Information Technology, Egyptian E-Learning University 2026 | Asyut, Egypt
Graduation Year: 2026

Projects & Practical Experience

Torostack

- Tech Stack: C#, ASP.NET Core Web API, Entity Framework Core, SQL Server, SignalR, MediatR, Clean Architecture, CQRS.
- Collaborated within a team to build a scalable backend utilizing Clean Architecture and the CQRS pattern to ensure high maintainability and strict separation of concerns.
- Engineered a Real-Time Multiplayer Engine using SignalR to facilitate live 1v1 coding battles, handling instant matchmaking, live state synchronization, and dynamic room-based leaderboards, and achieving sub-second latency.
- Developed the Community Groups module, designing complex relational database schemas with Entity Framework Core to manage role-based memberships and power group-specific ranking leaderboards.
- Integrated the Python-based AI Feedback model into the .NET infrastructure, managing HTTP communications to seamlessly deliver automated, real-time code evaluations and hints to users.

TicketOk

- Tech Stack: .NET 9, C#, ASP.NET Core Web API, Entity Framework Core, SQL Server, SignalR, MediatR (CQRS), Clean Architecture, GitHub Actions.
- Built a robust backend system using .NET 9, Clean Architecture, and CQRS for booking stadium events securely, supporting high-concurrency requests with 99.9% uptime.
- Integrated SignalR to manage high-concurrency seat locking and deliver real-time booking notifications.
- Implemented comprehensive features including JWT role-based authentication, a digital wallet, automated email workflows, and dynamic QR code PDF generation.
- Deployed the application utilizing a decoupled architecture via automated CI/CD pipelines (GitHub Actions, Vercel, and MonsterASP).

SH-Supplements

- Tech Stack: .NET 9, C#, ASP.NET Core Web API, Entity Framework Core, SQL Server, SignalR, MediatR (CQRS), Clean Architecture, FluentValidation.
- Architected a scalable e-commerce and health ecosystem integrating advanced shopping features, an affiliate coaching portal, and a digital wallet using Clean Architecture and CQRS.
- Engineered a robust checkout pipeline with optimistic concurrency control to prevent overselling, seamlessly integrated with a dynamic loyalty points system and automated commission distributions.
- Developed real-time event-driven features utilizing SignalR to broadcast live stock updates, trigger dynamic flash sales, and deliver personalized dosage reminders.
- Implemented innovative health-focused modules, including a smart stock conflict detector, an anti-counterfeit serial verification system, and automated BMI/BMR progress tracking.
- Enforced zero-trust security measures across the API, utilizing claim-based JWT extraction to strictly prevent IDOR vulnerabilities and ensure complete role-based data isolation.

Technical Skills

Programming Languages

C#, C++

Architecture & Patterns

Clean Architecture, CQRS (MediatR), RESTful APIs, SOLID Principles, OOP, Design Patterns

Real-Time & Cloud

SignalR, Microsoft Azure

Core & Soft Skills

Data Structures, Algorithms, Problem Solving, Teamwork, Time Management

Backend Development

.NET 9, ASP.NET Core Web API, Entity Framework Core, ASP.NET Core MVC, LINQ, ASP.NET Core Identity

Databases & Caching

Microsoft SQL Server, In memory database(Redis)

Tools, CI/CD & Version Control

Git, GitHub, Postman, Swagger, ClickUp, Agile/Scrum
